Deep Learning

-Neural Network Overview-

Artificial Neural Network

Biological Neurons and Neural network

What is Neural network in Computer Science domain?

- **A computer modeling approach** to computation that is **loosely based upon the architecture of the brain**.

- **Many different models, but all include:**
  - Multiple, individual “nodes” or “units” that operate at the same time (in parallel)
  - **A network that connects the nodes together**
  - **Information is stored** in a distributed fashion **among the links that connect the nodes**
  - **Learning** can occur with gradual **changes in connection strength**

Applications

Autonomous vehicle

Comparison of Brains and Traditional Computers

- 200 billion neurons (G), 32 trillion (T) synapses
- Element size: 10^{-6} m
- Energy use: 25W
- Processing speed: 100 Hz
- Parallel, Distributed
- Fault Tolerant
- Learns: Yes
- Intelligent/Conscious: Usually

- 16~256 billion bytes (GB) RAM but trillions of bytes (TB) on disk
- Element size: 10^{-9} m
- Energy watt: 30-90W (CPU)
- Processing speed: 10^{9} Hz (GHz)
- Serial, Centralized
- Generally not Fault Tolerant
- Learns: Some
- Intelligent/Conscious: Generally No

Why neural network?

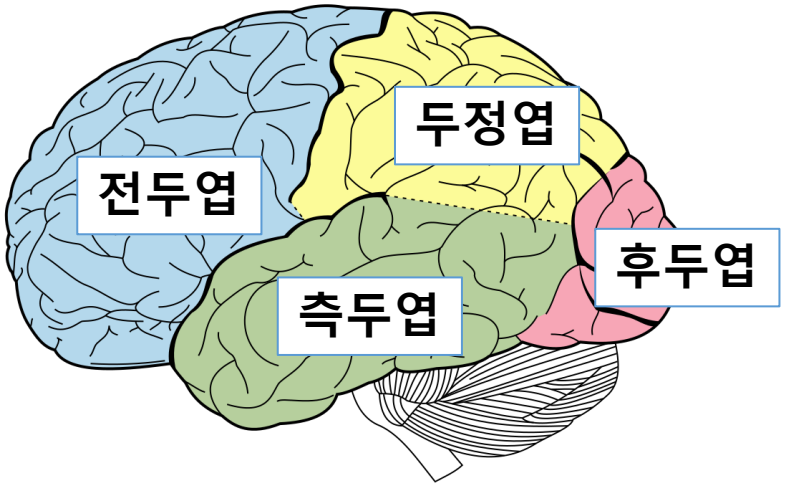
Artificial Intelligence :

- **Elaine Rich**
- Artificial Intelligence is the study of how to make computers do things at which, at the moment, people are better. (1983, Elaine Rich)
- 인공지능이란 컴퓨터에게 "현 시점(연구가 이루어지는 시점)에서" 컴퓨터보다 인간이 더 잘한다고 생각되는 일을 시키는 방법을 연구하는 것이다.

Idea : To make the computer more robust, intelligent, and learn, …

Let's **model our computer software (and/or hardware) after the brain.**

뇌 구조



전두엽: 기억력·사고력 등의 고등행동을 관장하며 다른 연합영역 으로부터의 정보를 조정하고 행동을 조절.

두정엽: 기관에 **운동명령**을 내리는 운동중추.
체감각 피질과 감각연합영역이 있어 촉각, 압각, 통증등의 체감각의 처리에 관여하며 피부, 근골격계, 내장, 미뢰로부터의 감각신호를 담당한다.

측두엽: 청각정보의 처리. 일차시각 피질에서 유래한 정보가 도달해 색, 모양등이 인지. 내측두엽 부분은 해마와 함께 **기억형성**에 주요한 역할을 수행.

후두엽: 시각정보의 처리. 눈으로 들어온 시각정보가 시각피질에 도착하면 사물의 위치, 모양, 운동 상태를 분석.

Neuron (cont'd)

Although heterogeneous, at a low level **the brain is composed of neurons.**

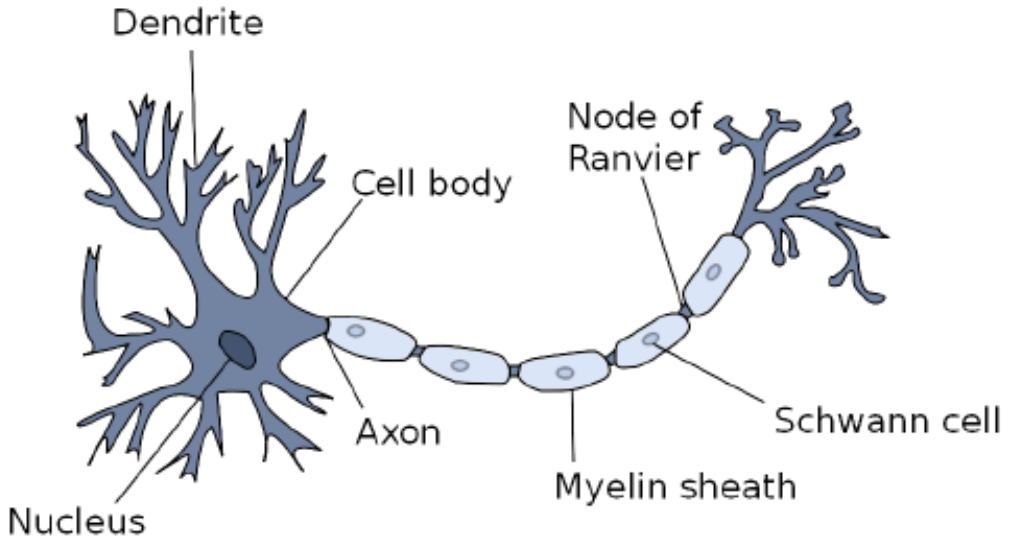

Figure 2.3: Illustration of a biological neuron with the components discussed in this text.

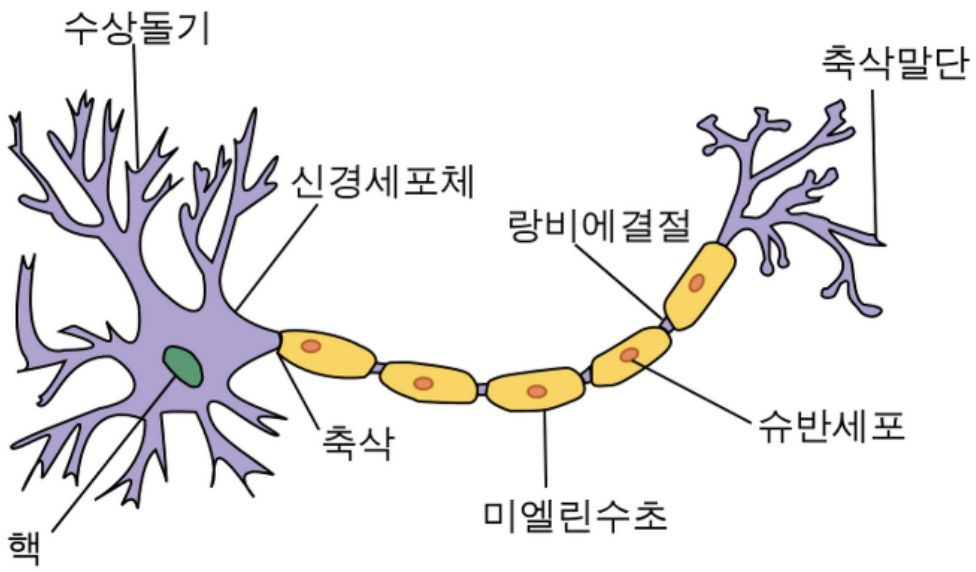
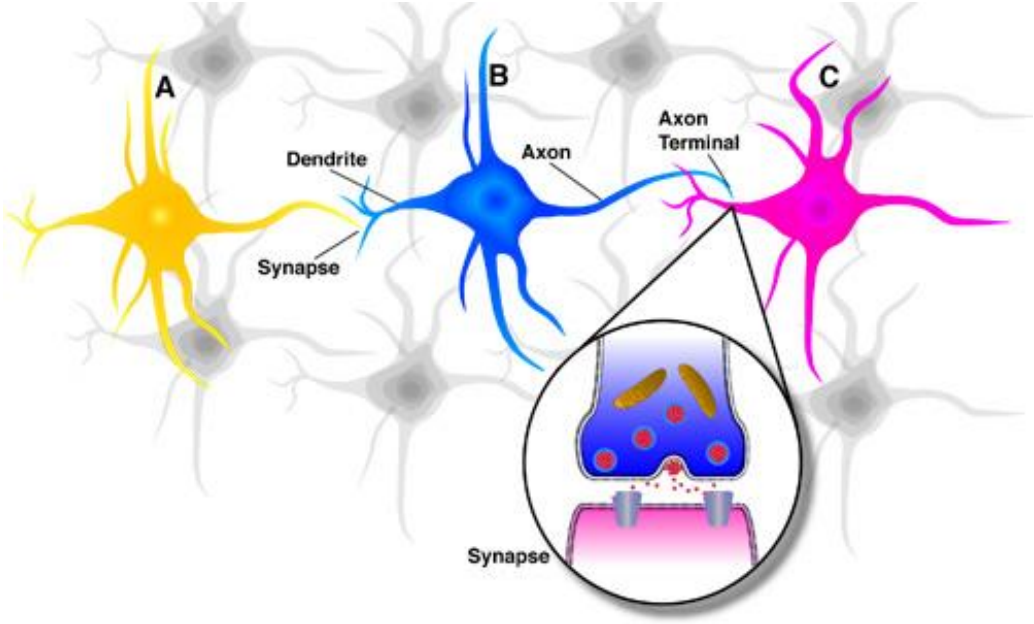


(출처/ 한글 위키피디아, '신경세포')

Neuron (cont'd)

- A neuron **receives input from other neurons** (generally thousands) from its synapses
- **Inputs are** approximately **summed.**
- When the input **exceeds a threshold** the **neuron sends an electrical spike** that travels from the body, down the axon, **to the next neuron(s)**



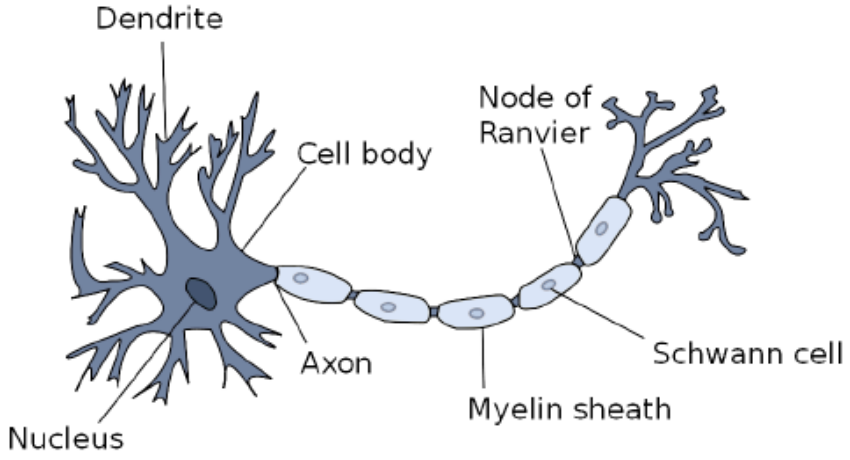


Figure 2.3: Illustration of a biological neuron with the components discussed in this text.

Learning in Brain

- **Brains learn**
  - 뉴런 사이의 **연결 강도 변화**
  - 뉴런 사이의 새 연결 생성/기존 연결 삭제

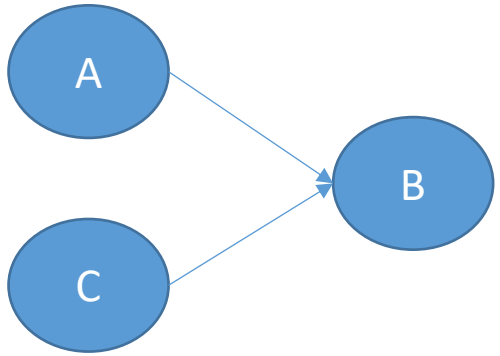
- **Hebb's Postulate (Hebbian Learning)**
  - 뉴런A의 축삭이 뉴런B를 흥분시키기(Exicited)에 충분히 가깝고
  - 반복적으로 또는 지속적으로 B를 발화(Firing)시키면
  - B를 발화시키는 뉴런 중 하나로서 A의 효율이 향상되도록 세포 연결구조가 변한다. **(연결 강도 변화)**
    - 한쪽 또는 양쪽 뉴런에서 성장과정 또는 대사변화가 일어난다.

- **Long Term Potentiation (LTP)**
  - 자극의 결과, 2개의 신경 세포 사이의 연결 강도 강화/약화된 상태가 장기간 유지되는 것.
  - 학습 및 기억을 위한 세포 기반.

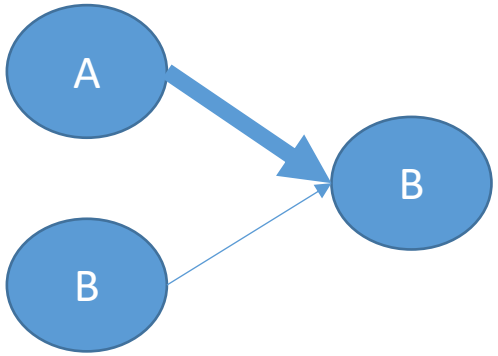
Learning in Brain: 예

- 뉴런 사이의 **연결 강도 변화**

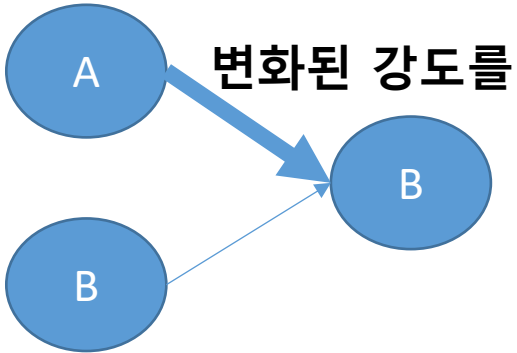
초기: 뉴런 A와 C가 다음 뉴런 B와 같은 강도로 연결되어 있다.
A가 Firing 하여 B가 Firing 하는 일이
C가 Firing하여 B가 Firing하는 일보다 훨씬 많이 반복되면,



후기: 뉴런 A와 뉴런 B 연결 강도가 커져
A가 Firing하는 즉시 B가 Firing하도록 변경된다.



- **Long Term Potentiation**



변화된 강도를 오랜 기간동안 유지

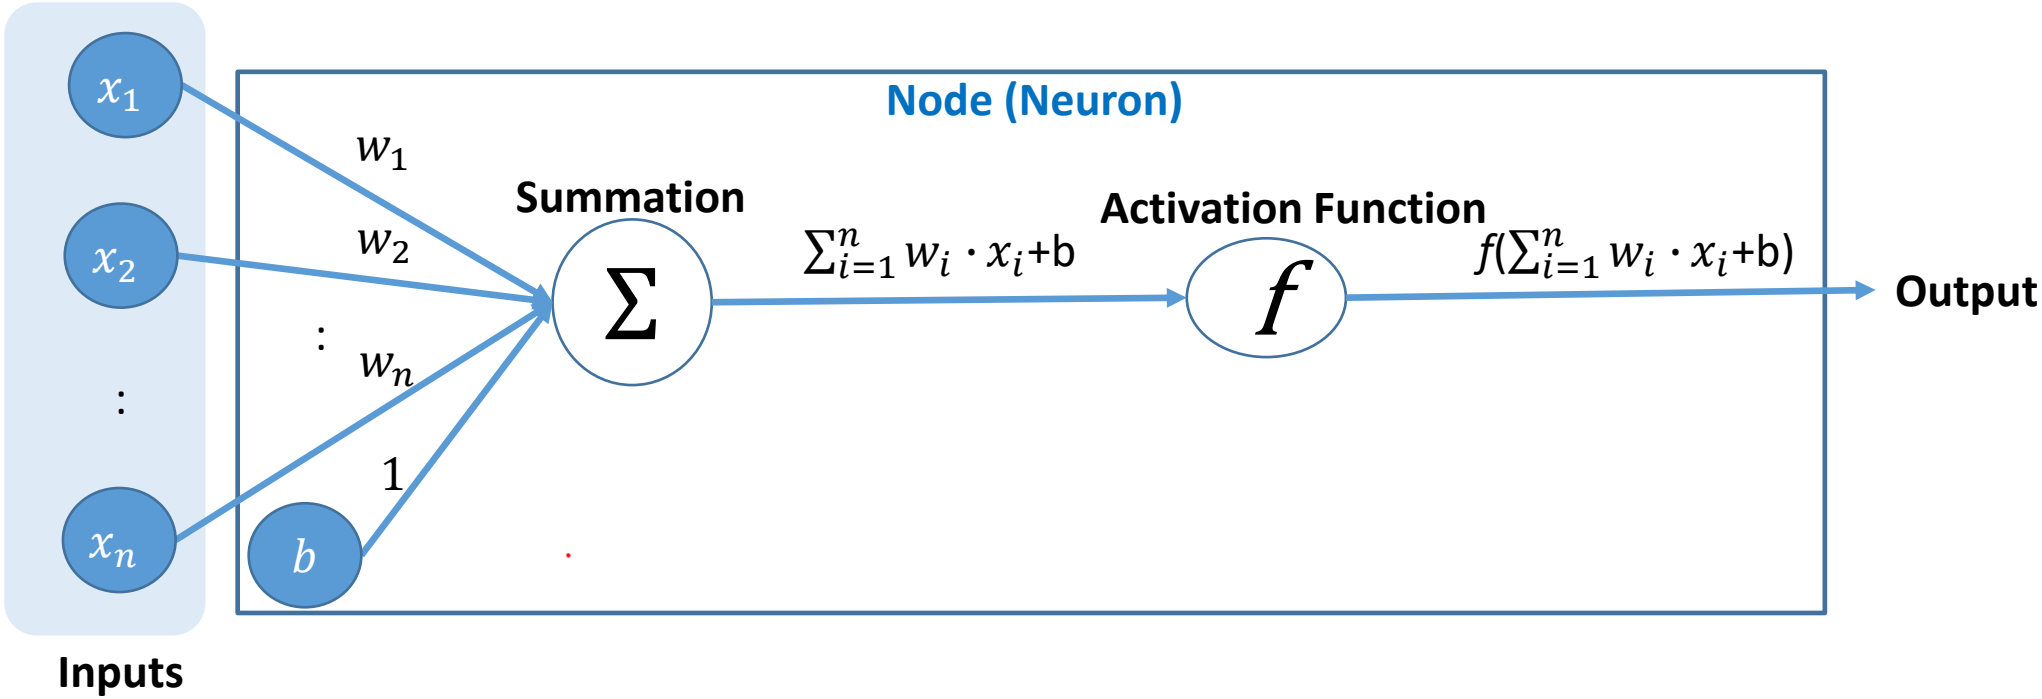
Summary

- Neural network is **a network that connects the nodes (Neuron) together**
- **Information is stored** in a distributed fashion **among the links that connect the nodes**
- **Learning** can occur with gradual **changes in connection strength.**

Artificial Neural Network

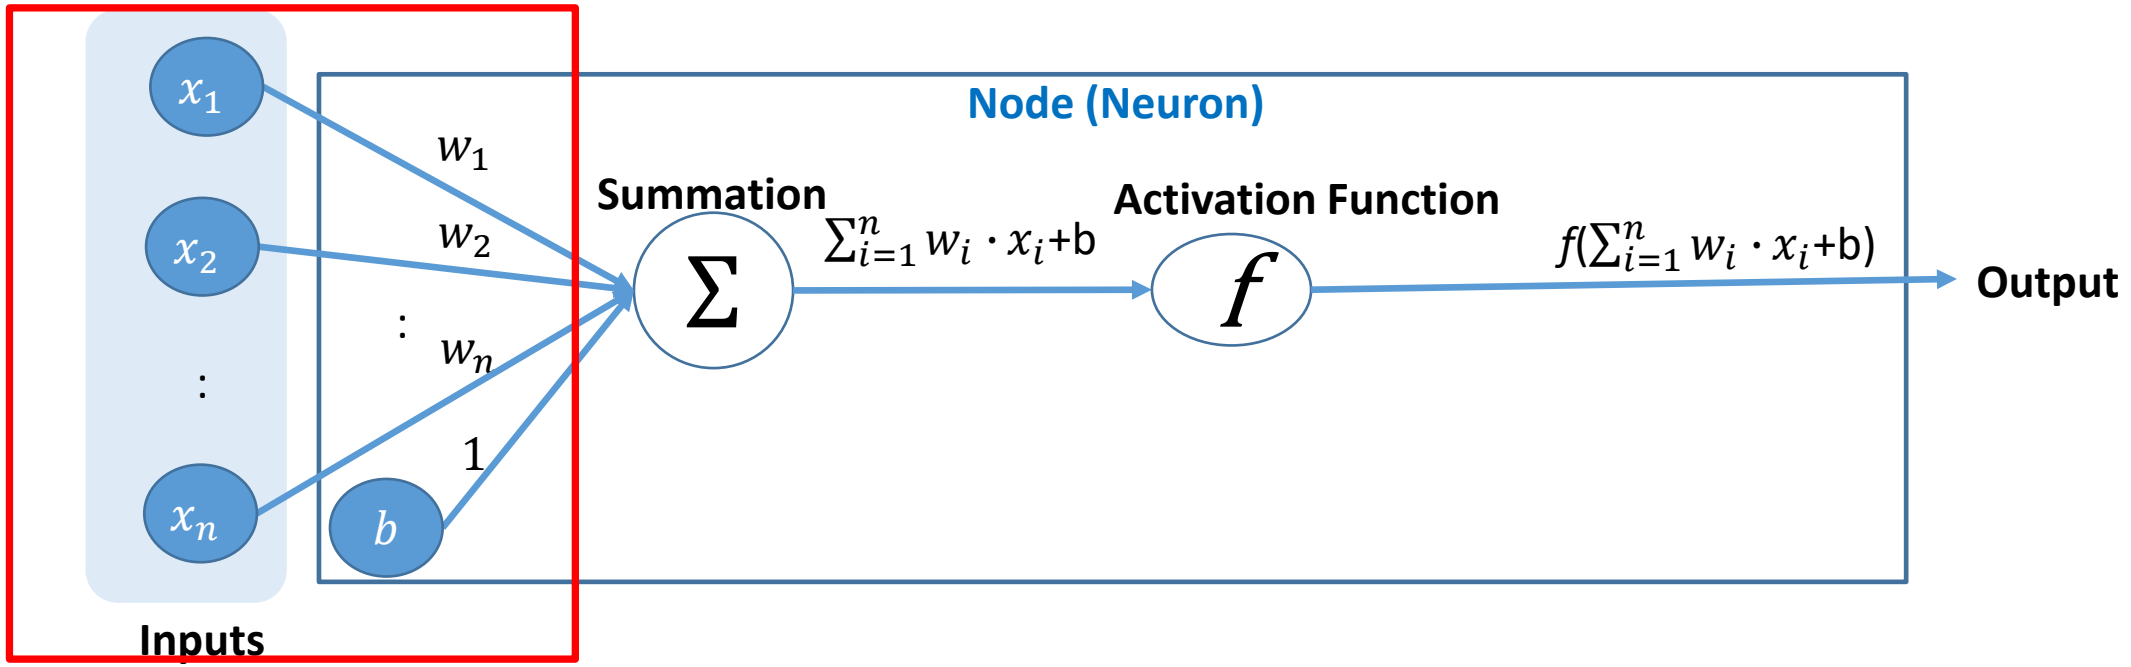
Neuron in Artificial Neural Network

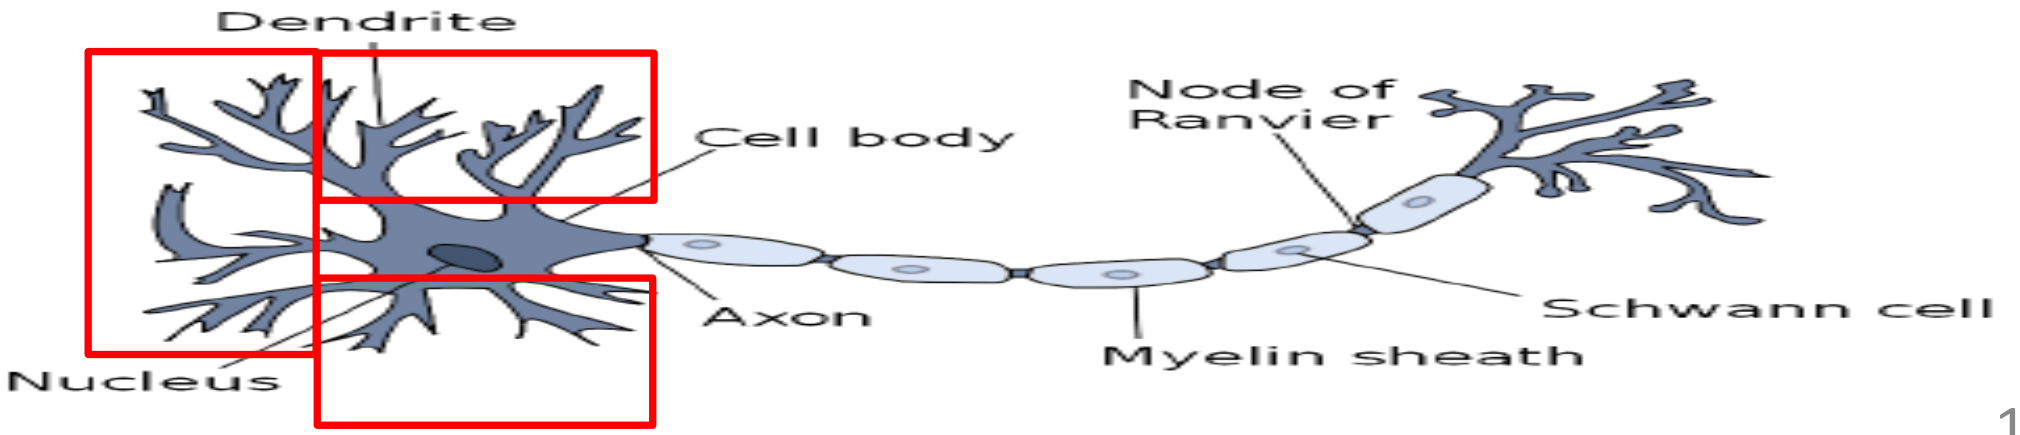
Node (Artificial Neuron)



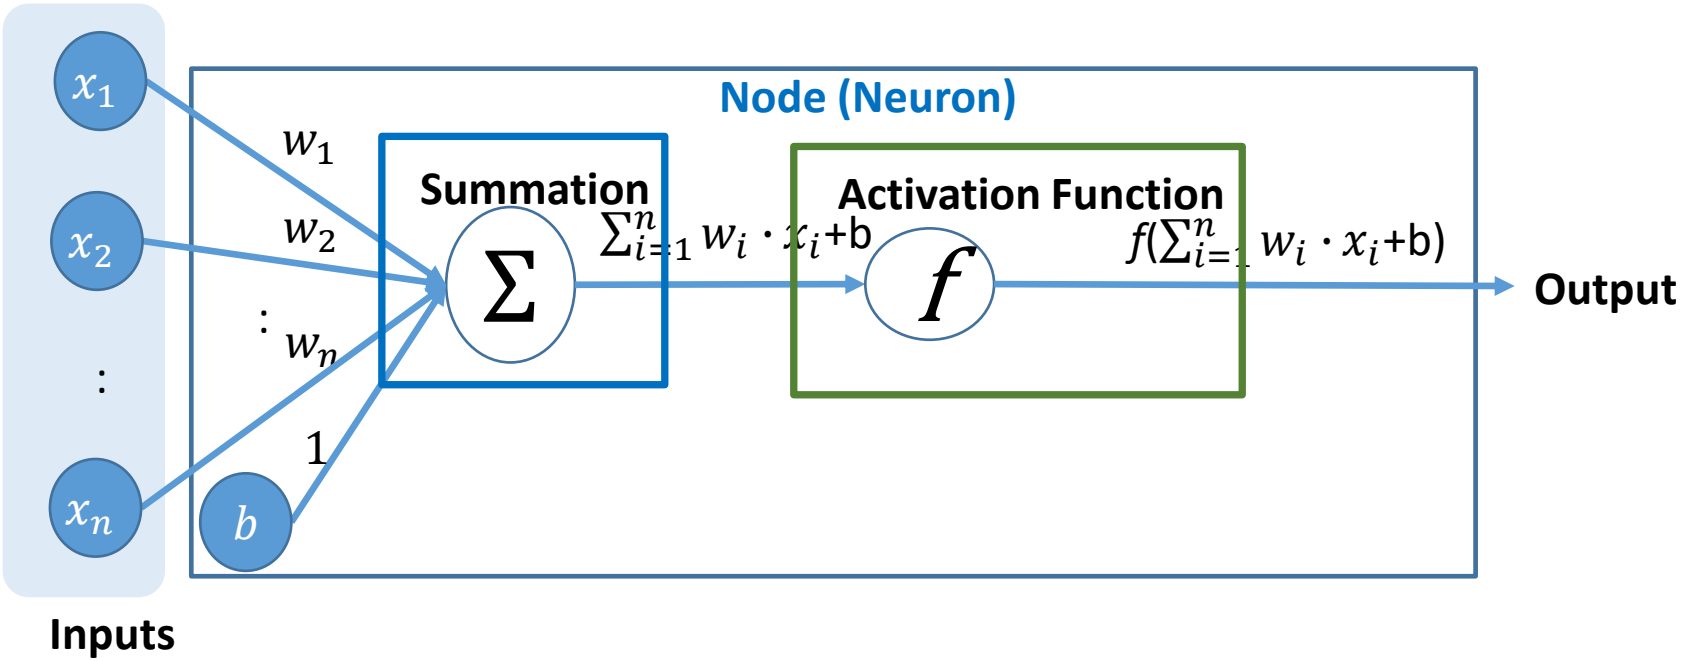
$x_1, x_2, \ldots, x_n$: 입력 값. 다른 Node 1, 2, … , n의 출력 값 .
$w_1, w_2, \ldots, w_n$: 입력 값에 대한 weight. (연결 강도)
b : bias.
f : activation function,

Node (Artificial Neuron) VS. Biological Neuron





Node (Artificial Neuron) VS. Biological Neuron (cont'd)



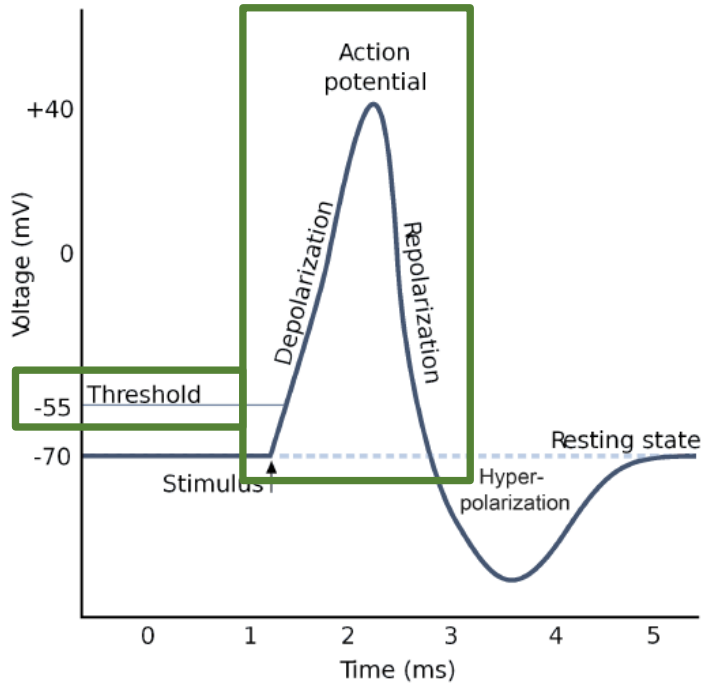


Figure 2.4: Initiation of action potential over time.

- **Inputs (Stimulus) are** approximately **summed.**
- When the input **exceeds a threshold** the **neuron sends an electrical spike** that travels from the body, down the axon, **to the next neuron(s)**

Activation Function : Logistic Function (Sigmoid)

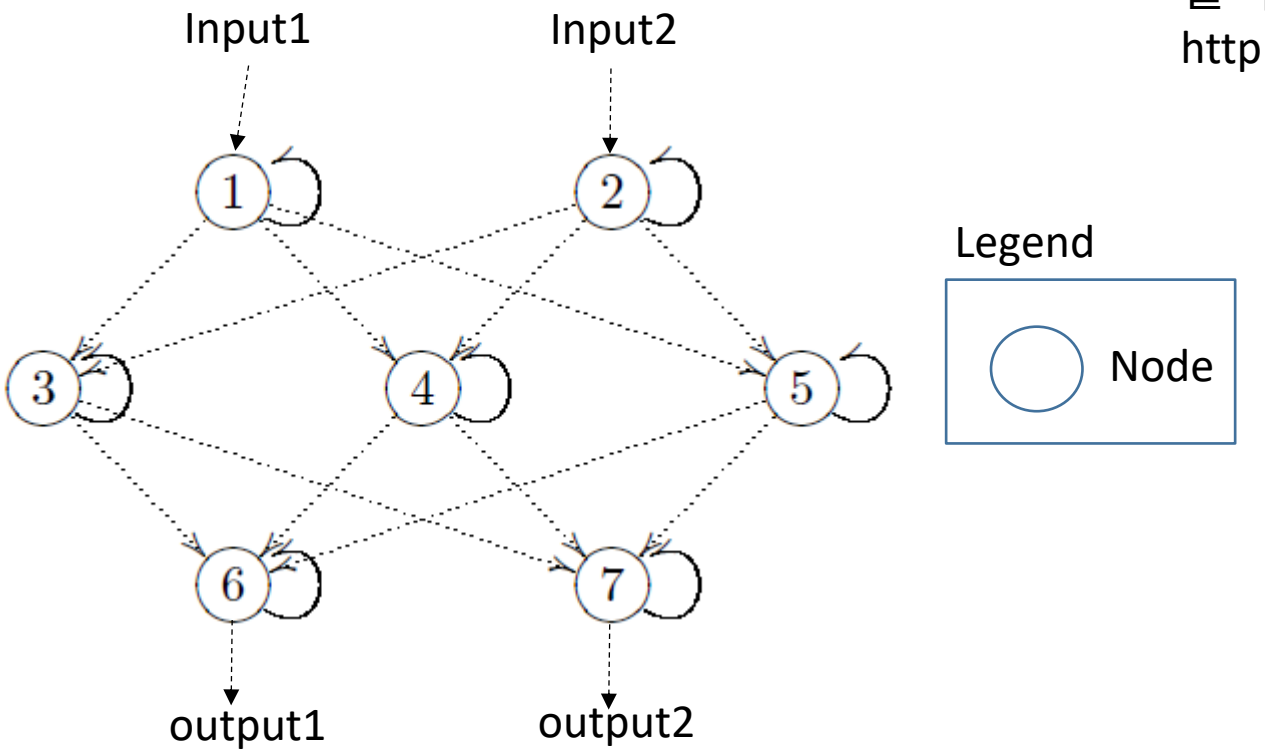

Figure 3.5: A network similar to a feedforward network with directly recurrent neurons. The direct recurrences are represented by solid lines.

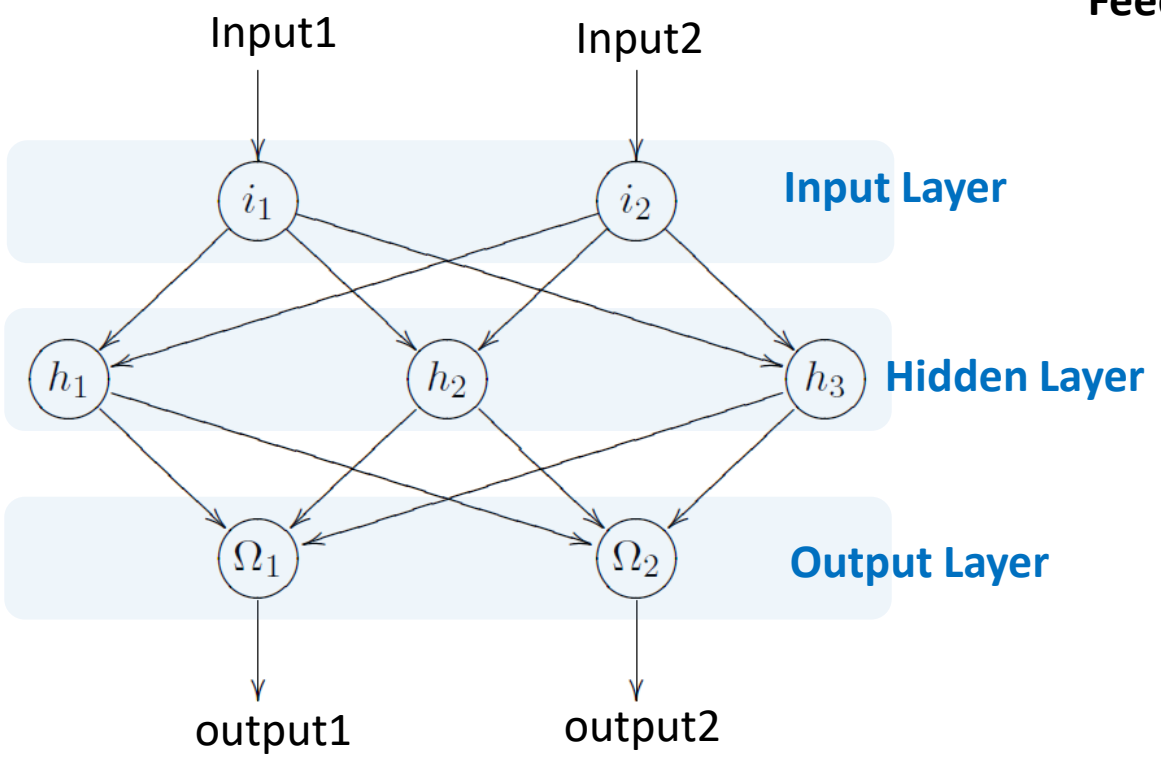
Feedforward Network (Fully Connected Network)



3 Layer로 이루어진 Neural network

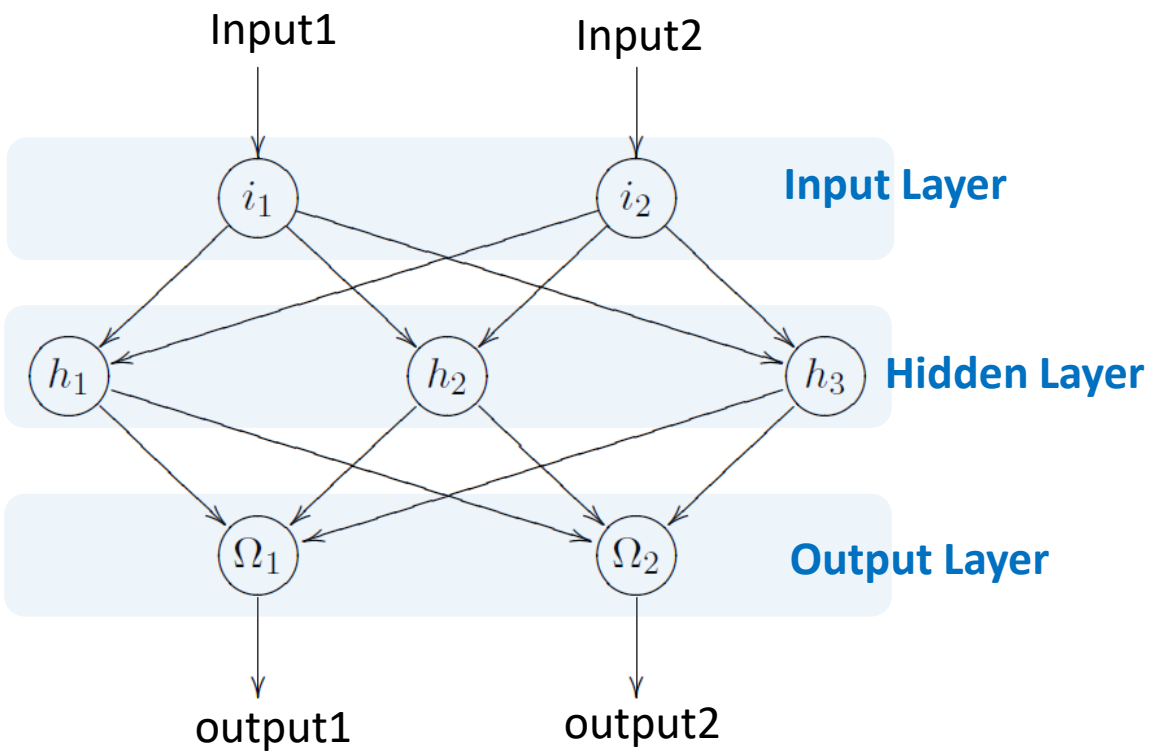
Feedforward Network

Network가 **여러 개의 Layer**로 구성된다.

하나의 Layer는 여러 개의 node로 구성된다.

- 제일 처음 Layer(Input Layer)를 제외한 모든 Layer의 각 node는 **이전 Layer에 속하는 모든 node의 output을 input으로 받는다.**
- Input Layer에 속하는 하나의 node가 feature vector 하나의 element(dimension)를 input으로 받는다.
- 같은 Layer에 속하는 node 사이, 혹은 node 자신에게는 연결하지 않는다.

Feedforward Network (Fully Connected Network) (Cont'd)



3 Layer로 이루어진 Neural network

Input Layer : Data 입력을 받기 위한 Layer.
- Network의 첫 Layer.
- Input Layer에 속하는 하나의 node가 feature vector 하나의 element(dimension)를 input으로 받는다.

Output Layer : 최종 결과를 출력하는 Layer.
- Network의 제일 마지막 Layer.
- Output layer의 모든 node의 output을 모아 output vector로 활용한다.

Hidden Layer : Input Layer와 Output Layer사이의 Layer.
- Layer가 여러 개(층) 존재할 수 있다.
- Hidden Layer 층 수가 많아지면 Deep이란 수식어가 붙는다.
